AS Roma & Winning Elevens

Danny Moncada

September 29th, 2019

Business Problem:

We have been hired by AS Roma as their resident data scientist to find patterns that our coach can exploit to increase success on the field and decrease failure. Specifically, he is looking for non-obvious patterns because he has learned all of the obvious ones through experience. He has asked us to use associations rules for this analysis and we have been provided data (euro_soccer.sqlite) to conduct our tests.

We have decided to take a multi-stepped approach to our proposed challenge. First, we want to determine what traits are specific to "successful" teams and what traits are specific to "losing" teams. We are going to do this by analyzing the top 4 teams in the top 4 leagues (16 teams total) and by analyzing the bottom 4 teams in the top 4 leagues (16 teams). We have chosen to focus on the top 4 leagues for determining these overall trends because AS Roma is part of Serie A, which is a competitive league. If we had focused on lower-tier leagues, there would be the potential for associations to appear that could not be applied to AS Roma.

After determining what "successful" and "losing" teams do in the top leagues (formations, # of shots, penalties, defense focus, offense focus, etc.), we will shift our attention to what makes great players. Though we would all love to say to simply hire Ronaldo or Messi, we understand that this simple solution is not feasible for AS Roma. However, we may learn insights into what types of players "successful" teams are most looking for. These characteristics may be speed, attacking rating, defense rating, crossing, heading, short pass, etc. After determining what characteristics make up the best players, which in turn make the best teams, we will move onto compiling our conclusions.

With these recommendations, we hope to tell our coach what hidden trends can help AS Roma become a more successful team. We hope to identify key characteristics in players, as well as key insights into team play that can lead AS Roma to victory.

Specifically, we hope to come up with actions that the Manager of Roma can take to get Roma in the top 4 teams in their Series so that they can go onto the Championship.

Definition of Success:

The top 4 teams in each league go on to the Championship which is tied to financial reward and prestige; finishing each season in the top 4 teams is what our team is defining as success. While it is hard to guarantee a top 4 finish, we are aiming to greatly increase the likelihood of Roma finishing there.

An Overview of team statistics

```

This is a base table for different types of analyses. We can use this to get counts of winners by Season/League - who are top performing teams?

```
## Show the top four leagues - by home winners
best_home_league[1:4,]
```

```
## # A tibble: 4 x 2
##   league                     n
##   <chr>                  <int>
## 1 England Premier League   160
## 2 France Ligue 1           160
## 3 Italy Serie A            160
## 4 Spain LIGA BBVA          160
```

Interpretation:

The 4 leagues with the most home team wins are England Premier League, France Ligue 1, Italy Serie A, and Spain LIGA BBVA.

```
## Next we'll filter our matches data to only have matches from these leagues
## We don't care about anything else

best_leagues <- c(best_home_league$league[1:4])
